How to obtain Google Community Mobility Reports?

<https://www.google.com/covid19/mobility/>

A screenshot of a Google search results page. The search bar contains the text "google community mobility reports". Below the search bar, there are navigation links for "All", "News", "Images", "Maps", "Shopping", and "More". The search results show "About 74,400,000 results (0.44 seconds)". The first result is titled "COVID-19 Community Mobility Reports - Google" and includes a snippet: "These Community Mobility Reports aim to provide insights into what is downloaded or used on the internet. To download or use the data or reports, you must agree to the Google Terms of Service. You've visited this page 4 times. Last visit: 6/01/21". The second result is titled "Mobility Report CSV Documentation - Google" and includes a snippet: "Return to Community Mobility Reports. Mobility Report CSV Documentation is intended to help remediate the impact of COVID-19. It shouldn't be ...".

COVID-19 Community Mobility Reports

See how your community is moving around differently due to COVID-19

As global communities respond to COVID-19, we've heard from public health officials that the same type of aggregated, anonymized insights we use in products such as Google Maps could be helpful as they make critical decisions to combat COVID-19.

These Community Mobility Reports aim to provide insights into what has changed in response to policies aimed at combating COVID-19. The reports chart movement trends over time by geography, across different categories of places such as retail and recreation, groceries and pharmacies, parks, transit stations, workplaces, and residential.

How to obtain Google Community Mobility Reports?

Community Mobility Reports

Reports created 2021-05-10.

How Google CMR are derived?

Raw data: use Google Maps to detect the changes of mobility using the aggregated and anonymized user data showing the popular times for places (six types) in Google Maps.

Measures: how visits and length of stay at different places change compared to a baseline for that day of the week — the baseline is the median value of mobility during the 5-week period Jan 3–Feb 6, 2020.

Potential bias: the datasets show trends over several months with the most recent data representing approximately 2-3 days ago—this is how long it takes to produce the datasets.

How Google CMR are derived?

Six types of places

Grocery & pharmacy (grocery markets, food warehouses, farmers markets, specialty food shops, drug stores, and pharmacies)

Parks (local parks, national parks, public beaches, marinas, dog parks, plazas, and public gardens)

Transit stations (public transport hubs such as subway, bus, and train stations)

Retail & recreation (restaurants, cafes, shopping centers, theme parks, museums, libraries, and movie theaters)

Residential (places of residence)

Workplaces (places of work)

How Google CMR are derived?

Example: how a public holiday/weekend can affect people's travel behavior

How Google CMR are derived?

'Weird' weekly pattern

(A) Australia

Features of four types of mobility data:

1. Public transit system data;
2. Social activity; --- Google CMR
3. Index-based mobility data;
4. Social media-derived mobility data

Data Category	Name and Provider	Region and scale	Available Time	OD Flow	Availability	Strengths	Weaknesses	Selected References
Public Transit System	Air flight International Air Transport Association (IATA)	Worldwide	Since 2010	Yes	Private	Rich information for business intelligence. Aggregated statistics for various applications	Mostly private data	Menkir et al., 2021 Bogoch et al., 2020
	OpenSky-Network	Worldwide, mostly for Europe and North America	Since 2012	Yes	Public	Detailed tracking information	API limitations	Zhuang et al., 2020 Iacus et al., 2020
	Train Transit system / dataset in different countries (e.g., China, U.S., Italy)	China, USA, Italy (by state, city, district)	Different for different regions	Yes	Public	Available in countries where there is a booking website	Real-time data but without history data or sometimes web crawling needed	Zhang et al., 2020; Carteni et al., 2020 Hu et al., 2020
	Metro Transport authority (e.g., MATSim-NYC)	U.S.	Different for different regions	No	Public	Detailed ridership data, at the station level	Non-trackable; no route record	Zheng et al., 2020; Ahangari et al., 2020
Social Activity	Apple Mobility Trends Report	Worldwide/city, county, state	04/14/2020 ~ present	No	Public	global wide; one single file; data divided by country/region, sub-region, city	data source method (requests for direction in Apple Maps)	Huang et al., 2020b Kurita et al., 2021; Hadjidemetriou et al., 2020
	Google Mobility Reports	Worldwide/city, county, state	2/15/2020 ~ present	No	Public	global wide; one single file	not comparable among countries	Pepe et al., 2020; Delen et al., 2020; Rutz et al., 2020
	Foursquare Mobility Reports	U.S./county, state	02/19/202 ~ present.	No	Submit Application	Available in 25 types of POI and by age group	Only available in U.S.	Gao et al., 2020 Fathi-Kazerooni et al., 2020 Ding et al., 2020
	SafeGraph Mobility Reports	U.S./census tract, county, and state	01/01/2019 ~ present	Yes	Submit Application	Varieties of data categories	Data are only available on Amazon S3	Li et al., 2020 Kang et al., 2020
Index-based Mobility Data	Cuebiq Mobility Index	U.S. at multiple geographic levels	01/01/2020	No	Submit Application	Available in DMA level; index allows counties to be compared to one another	Only available in U.S.	Fraiberger et al., 2020 Pepe et al., 2020
	Baidu Mobility Index	China/city and province	1/1/2020 ~ 5/7/2020 & 9/3/2020 ~ present	Yes	Public	inter/intro-city mobility index	Not publicly accessible after May 7 2020, only available for Mainland China	Ze-Liang et al., 2020 Liu et al., 2020 Xu et al., 2020
	Descartes Lab Mobility Index	U.S./county and state	03/01/2020 ~ 06/06/2020	No	Submit Application	accurate positioning data (m50 score based on normalization methods)	Inter-city index not covered; only freely available in a certain period of time and scale	Warren et al., 2020 Gao et al., 2020; Chen et al., 2020
	Unacast Social Distancing Index	U.S.	02/24/2020 ~ present	No	Submit Application	Granular data, available down to specific data points; bias correction based on classifications of businesses	Since data is coming from third party sources, people may have to agree to consent on those sources	Brodeur et al., 2021
	University of Maryland Mobility Metrics and Social Distancing Index	U.S./county and state	01/01/2020 ~ present	No	Submit Application	Integrated and cleaned location data from multiple sources; be highly representative	Only available in the U.S.	Zhang et al., 2020 Lee et al., 2020 Ghader, et al., 2020
	Camber Systems Social Distancing Reporter	U.S./county	08/01/2020 ~ present	No	Submit Application	Integrating multiple data sources; less biased and more representative; easy to interpret	subject to calibration; only available in U.S. county level; no data before August 2020	Jeffrey et al., 2020
Social Media-Derived Mobility Data	Geotagged Tweets	Worldwide/any spatiotemporal scale	01/01/2018 ~ present	Yes	Public	Worldwide coverage, real-time, aggregation-flexible	Bias in population, low penetration	Huang et al., 2020a Li et al., 2021 Su et al., 2020
	Facebook Movement Range Maps	Worldwide	01/03/2020 ~ 31/08/2020	No	Submit Application	Machine-readable format that is global and free of charge	Only provided by mobile phone users who have enabled location history	Lau et al., 2020; Kuchler et al., 2020 Beria et al., 2021

What is the specialty of Google CMR?

Comparison across other types of society activity data

Data Category	Name and Provider	Region and scale	Available Time	OD Flow	Availability	Strengths	Weaknesses	Selected References
Social Activity	Apple Mobility Trends Report	Worldwide/city, county, state	04/14/2020 ~ present	No	Public	global wide; one single file; data divided by country/region, sub-region, city	data source method (requests for direction in Apple Maps)	Huang et al., 2020b Kurita et al., 2021; Hadjidemetriou et al., 2020

What is the specialty of Google CMR?

Advantages:

Global scale (including 133 countries)

Some countries have a finer level data (e.g. State/City)

Long temporal coverage (Feb 15, 2020 to present)

Publicly available (easy to download and process)

Disadvantages:

Data representativeness (subject to Google Users)

Less comparable across countries

Case studies using Google CMR in below countries:

Australia, United States, South Korea, Sweden, Italy, France, Spain, and 23 European countries; 100 countries comparison

Authors/Title	Data used	Method	Application
Pepe et al.	Google Community Mobility Dataset; Apple mobility Trends Report; Cuebiq data for Good	Python 3; Pearson's correlation coefficient	A dataset to assess mobility changes in Italy following national lockdown: It presents daily time-series of three different aggregated mobility metrics by using cuebiq data:— the origin-destination movements between Italian provinces, the radius of gyration, and the average degree of a spatial proximity network,
Rutz et al.	801 publicly visible animal tracking studies from the move bank research platform ; Google Community Mobility Dataset	QGIS	To quantify the effects of human activity on wildlife: Using google community mobility data (local parks, national parks, public beaches, marinas, dog parks, plazas and public gardens)
Wellenius et al.	Google Community Mobility Dataset		Conclusion: state-wide mandates are effective in promoting social distancing within this study group.
Delen et al.	GPS mobility data from Google , Apple ; disease statistics from the European Centre for Disease Prevention and Control	machine learning, Gradient boosted trees regression analysis	Conclusion: Consistent with simulation-based studies, real cross-national transactional data confirms the effectiveness of social distancing interventions in slowing the spread of COVID-19
Morita et al.	Google Community Mobility Dataset ; Stringency Index Cases and death; Democracy Index	generalized linear mixed model	The study shows that the status of the infection spread and policy implementation uniformly influence behavior restrictions across every country. Furthermore, it suggests that the differences in the key contents of the social distancing policies and the socioeconomic status of each country may influence the ratio of behavior changes.
Vokó et al.	Google Community Mobility Dataset ; ECDC data	Poisson regression; interrupted time series analysis; multivariate regression analysis	Conclusion : The unprecedented “stay-at-home” national policies meaningfully contributed to the suppression of the COVID-19 pandemic in Europe
Klonowska and Bindt et al.	Google Community Mobility Dataset ; Austria stay-at home data		Two waves of technological responses in the European Union: 1. anonymized phone location tracking 2. contact tracing apps Both waves of technological solutions are discussed in terms of privacy, transparency, and effectiveness.
Juranek et al.	Google Community: Mobility Dataset ; regional weekly numbers (statistic Denmark)	regression model	This paper studies the labor market effects of non-pharmaceutical interventions (NPIs) to combat the COVID-19 pandemic
Bucsky	transport automatic measured data (Budapest Roads Ltd) ; Google Community Mobility Dataset ; bike sharing system (BSS) usage data (BKK) ;	Compared to last year	To analyze the changes made to patterns of transport by movement restrictions (Measurement of time spent outside home and workplace was taken from Google.)
Dasgupta et al.	Mobile device location data ; Google Community Mobility Dataset	Negative binomial regression	Conclusion: We found that the adoption of social distancing practices was strongly correlated with better community health and financial resources. Our findings also suggest the need to innovate additional measures to prevent viral transmission in places where social distancing is less feasible.

How to use Google CMR in COVID-19 studies?

---- Review paper on COVID-19 and human mobility

Key findings in terms of research aims:

- 1) **Policy implementation and evaluation:** examine the effectiveness of policy-induced mobility control on COVID-19
- 2) **Simulation and prediction:** predict the COVID-19 dynamic through modeling or simulating human mobility or its related measures
- 3) **Cross-country/region comparison:** compare studies presenting the association between human mobility and COVID-19 across countries or regions

Received: 7 September 2020; Accepted: 27 October 2020; Published: 29 October 2020

Abstract: The policy induced decline of human mobility has been recognised as effective in controlling the spread of COVID-19, especially in the initial stage of the outbreak, although the relationship among mobility, policy implementation, and virus spread remains contentious. Coupling the data of confirmed COVID-19 cases with the Google mobility data in Australia, we present a state-level empirical study to: (1) inspect the temporal variation of the COVID-19 spread and the change of human mobility adherent to social restriction policies; (2) examine the extent to which different types of mobility are associated with the COVID-19 spread in eight Australian states/territories; and (3) analyse the time lag effect of mobility restriction on the COVID-19 spread. We find that social restriction policies implemented in the early stage of the pandemic controlled the COVID-19 spread effectively; the restriction of human mobility has a time lag effect on the growth rates of COVID-19, and the strength of the mobility-spread correlation increases up to seven days after policy implementation but decreases afterwards. The association between human mobility and COVID-19 spread varies across space and time and is subject to the types of mobility. Thus, it is important for government to consider the degree to which lockdown conditions can be eased by accounting for this dynamic mobility-spread relationship.

Keywords: human mobility; COVID-19 spread; global pandemic; social restriction policy; Australia

How to use Google CMR in COVID-19 studies?

---- Case Study in Australia

Research Questions: How is the change of human mobility adherent to policy and associated with COVID-19 transmission in Australia?

Background:

How to use Google CMR in COVID-19 studies? ---- Case Study in Australia

Data:

Google CMR at the state and national level

COVID-19 data in Australia by state (Department of Public Health,2020)

Method:

- 1) **Temporal analysis** of mobility and policy implementation
- 2) Construction of a **combined mobility index** (CMI) --- calculated as the mean of the mobility of each type i in a day t :

$$CMI(t) = \frac{\sum_{i=1}^6 \text{Mobility}_i}{6}.$$

How to use Google CMR in COVID-19 studies? ---- Case Study in Australia

Method:

3) Construction of two COVID-19 measures:

Growth rate (%) of confirmed cases at day t is calculated as:

$$GR(t) = \frac{C(t) - C(t-1)}{C(t-1)},$$

Doubling time (day) of confirmed cases at day t is calculated as:

$$DT(t) = \frac{\ln(2)}{\ln(1 + GR(t))}.$$

where $C(t)$ is the cumulative number of confirmed cases at day t.

How to use Google CMR in COVID-19 studies? ---- Case Study in Australia

Method:

3) Selection of **three modelling scenarios**:

- right after the lockdown date
- 7 days after the lockdown date
- 14 days after the lockdown date

4) **Pearson correlation analysis** between CMI and GR/DT

5) A **panel regression analysis** between six types of mobility changes and GR/DT

$$COV_{s,t} = \alpha_S + \beta_i Mob_{i, s,t-n} + \gamma_t + \varepsilon_{s,t} \quad (n = 0, 1, \dots, t - 1),$$

Results:

The timeline of policy implementation

The panel regression between mobility changes and growth rate / doubling time in three time period:

- 1) Right after lockdown
- 2) 7 days after lockdown
- 3) 14 days after lockdown

Solid bars: significant ($p < 0.01$) Pattern-fill bars: insignificant

■ RetailRecreation ■ GroceryPharmacy ■ Parks ■ TransitStations ■ Workplaces ■ Residence

Conclusions

- First, a visual inspection of the COVID-19 cases and mobility level alongside the timeline of policy interventions in Australia suggests that **social restriction policies controlled the COVID-19 spread effectively in the early stage** of the first wave of the pandemic.
- Second, the control of mobility has **a time lag effect on COVID-19 spread as the span of the mobility-spread relation lasts from 7 to 14 days**, which is possibly tied to the incubation period.
- Third, there exists **a dynamic association** between mobility in different types and COVID-19 spread, and the magnitude of such an association varies across space and time.

Abstract: Studies on human mobility have a long history with increasingly strong interdisciplinary connections across social science, environmental science, information and technology, computer science, engineering, and health science. However, what is lacking in the current research is a synthesis of the studies to identify the evolutionary pathways and future research directions. To address this gap, we conduct a systematic review of human mobility-related studies published from 1990 to 2020. Drawing on the selected publications retrieved from the Web of Science, we provide a bibliometric analysis and network visualisation using CiteSpace and VOSviewer on the number of publications and year published, authors and their countries and affiliations, citations, topics, abstracts, keywords, and journals. Our findings show that human mobility-related studies have become increasingly interdisciplinary and multi-dimensional, which have been strengthened by the use of the so-called 'big data' from multiple sources, the development of computer technologies, the

Further studies on human mobility

Data and method

Research Protocol	Detail Description
Research database	WOS core collection: SCI-Expanded and SSCI
Publication type	All types: articles, review and editorial, conference proceeding papers, book chapters and review, meeting abstract, data papers, reprints, letters, correction and retracted publications.
Language	English
Year range	1990 to 2020 September
Search field	Topic including titles, abstracts, and keywords
Search term	Human mobility; mobility pattern; human trajectory; human migration; human immigration; population migration; population immigration; population mobility; rural mobility; urban mobility; migration flow; immigration flow; mobility network; migration network; immigration network
Data extraction	Export with full records and cited references in plain text format
Data analysis and visualisation	CiteSpace, VOSviewer
Sample size	5728 publications

Key findings

THE UNIVERSITY
OF QUEENSLAND
AUSTRALIA

Future directions of human mobility studies

1. The involvement of multi-source mobility data
2. The improvement of modelling individual and collective mobility patterns
3. The contribution of human mobility studies to social good
4. The integration of AI techniques in human mobility studies (e.g., machine learning, deep learning, etc)
